

Experiment no 4

Title: Running a python application over docker.

Aim: To run a python program over docker.

Theory:

A Quick Overview Of The Concepts

In a nutshell, we are going to create a docker file that we will use to build a docker image which we will then run in a docker container.

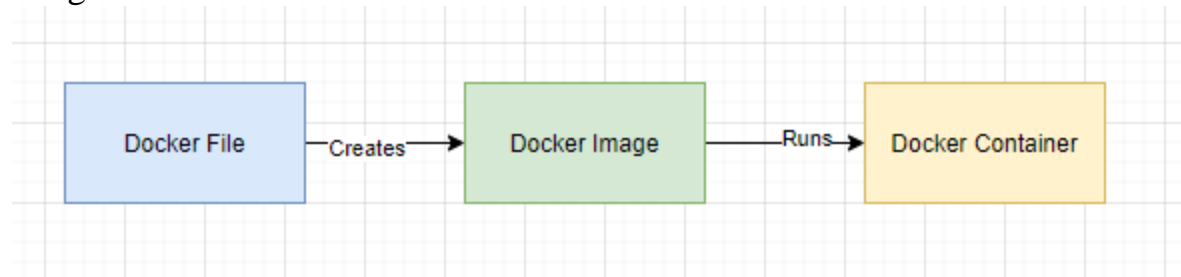

Image By Author

What is Docker?

Docker is a software platform. It enables software developers to develop, ship and run applications within its containers. Containers are lightweight software applications. We are going to build a Docker image in this experiment.

What is a docker file, image and container?

A docker file is a text file that contains the set of instructions for the Docker platform. Therefore, it can be versioned and committed to a code repository.

An image includes everything needed to run an application — the code or binary, runtime, dependencies, and any other file system objects required.

Docker containers run the application code.

Now that the theory is done, let's get started with a practical exercise. we are going to build a Python program and then run it inside a Docker container.

There are essentially 5 steps:

1. Create your python program (skip if you already have a Python program code)
2. Create a docker file
3. Build the docker file into an image
4. Run the docker image in a container
5. Test the Python program running within a container

Containers are lightweight software applications. They offer a number of benefits including a reduction in time to deliver an application, scalability, ease of application management, support and better user experience.

While building Python applications, your working directories (workdir) play key roles. Pointing your application towards critical configuration files and other resources during runtime is critical. This allows your Python app to run effectively and predictably. Custom directories let your applications run in a well-defined state, which is perfect for testing and deployment.

Creating a Dockerfile

- **FROM** tells Docker which image you base your image on (in the example, Python 3).
- **RUN** tells Docker which additional commands to execute.
- **CMD** tells Docker to execute the command when the image loads.

The Python script `my_script.py` looks like the following:

```
[root@ip-172-31-83-100 ~]# cat my_script.py
# Sample taken from pyStrich GitHub repository
from pystrich.datamatrix import DataMatrixEncoder

encoder = DataMatrixEncoder('This is a DataMatrix.')
encoder.save('./datamatrix_test.png')
print(encoder.get_ascii())
[root@ip-172-31-83-100 ~]#
```

root@ip-172-31-83-100:~

```
[root@ip-172-31-83-100 ~]# cat my_script.py
# Sample taken from pyStrich GitHub repository
from pystrich.datamatrix import DataMatrixEncoder

encoder = DataMatrixEncoder('This is a DataMatrix.')
encoder.save('./datamatrix_test.png')
print(encoder.get_ascii())
[root@ip-172-31-83-100 ~]# docker build -t python-barcode .
```

root@ip-172-31-83-100:~

```
[root@ip-172-31-83-100 ~]# cat my_script.py
# Sample taken from pyStrich GitHub repository
from pystrich.datamatrix import DataMatrixEncoder

encoder = DataMatrixEncoder('This is a DataMatrix.')
encoder.save('./datamatrix_test.png')
print(encoder.get_ascii())
[root@ip-172-31-83-100 ~]# docker build -t python-barcode .
```

root@ip-172-31-83-100:~

```
[root@ip-172-31-83-100 ~]# docker build -t python-barcode .
Sending build context to Docker daemon 12.29kB
Step 1/4 : FROM python:3
3: Pulling from library/python
f606d8928ed3: Extracting 557.1kB/55.05MB
47db815c6a45: Download complete

```

To see created image

```
$ docker images
```

```
[root@ip-172-31-83-100 ~]# docker images
REPOSITORY      TAG          IMAGE ID      CREATED        SIZE
python-barcode   latest       0894ed474461  About a minute ago  953MB
python           3           f05c8762fe15  4 days ago     921MB
[root@ip-172-31-83-100 ~]#
```

Run Your Image

After your image has been built successfully, you can run it as a container. In your terminal, run the command `docker images` to view your images. You should see an entry for “python-barcode”. Run the new image by entering:

```
docker run python-barcode
```

```
root@ip-172-31-83-100~  
python-barcode latest 0894ed474461 About a minute ago 953MB  
python 3 f05c8762fe15 4 days ago 921MB  
[root@ip-172-31-83-100 ~]# docker run python-barcode  
  
XX XX XX XX XX XX XX XX XX XX  
XX XX XX XXXX XX XX XX XXXX  
XXXX XX XX XXXX XXXXXX XX  
XX XXXX XXXX XXXX XX XX  
XX XX XXXX XX XX  
XXXXXXXX XX XX XX XXXX XXXXXX XXXX  
XXXX XX XXXX XXXX XX XX  
XXXX XX XXXXXX XXXX XXXXXX  
XX XX XX XXXXXX XX XX XX  
XX XX XXXX XX XXXX XXXXXX XX  
XXXX XX XX XXX XXXXXX XX  
XX XX XXXXXX XX XX XXXX XX XX  
XX XXXXXX XX XXXX XX XXXX XX  
XXXX XX XXXX XX XX XXXX  
XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX  
  
[root@ip-172-31-83-100 ~]#
```

Conclusion: Thus we have successfully run the python application over docker.
